

The Impact of Good Requirements Analysis

A Human Genomes Platform Project Case study

B. Pope, J. Holliday, K. Davies

Kylie Davies
Senior Business Analyst
Australian Access Federation
kylie.davies@aaf.edu.au

What is Requirements Analysis?

Requirements, specifications and models are the building blocks for a new or enhanced system.

Current state

User Stories/Use Cases

Business rules

Community constraints

Domain knowledge

Technology

Why requirements analysis is a group activity

- Some are deep in the weeds
- Working at different levels

The business analyst is neutral.

Guides, elicits, shapes.

Group review:

- shapes, scopes requirement
- builds team, trust
- clarifies strengths

The role of the business analyst

- Not a subject matter expert
- Quickly builds rapport with end users & key stakeholders.
- Prickly stakeholders are our specialty.
- Get us in early.

Why not just get requirements from a subject matter expert directly?

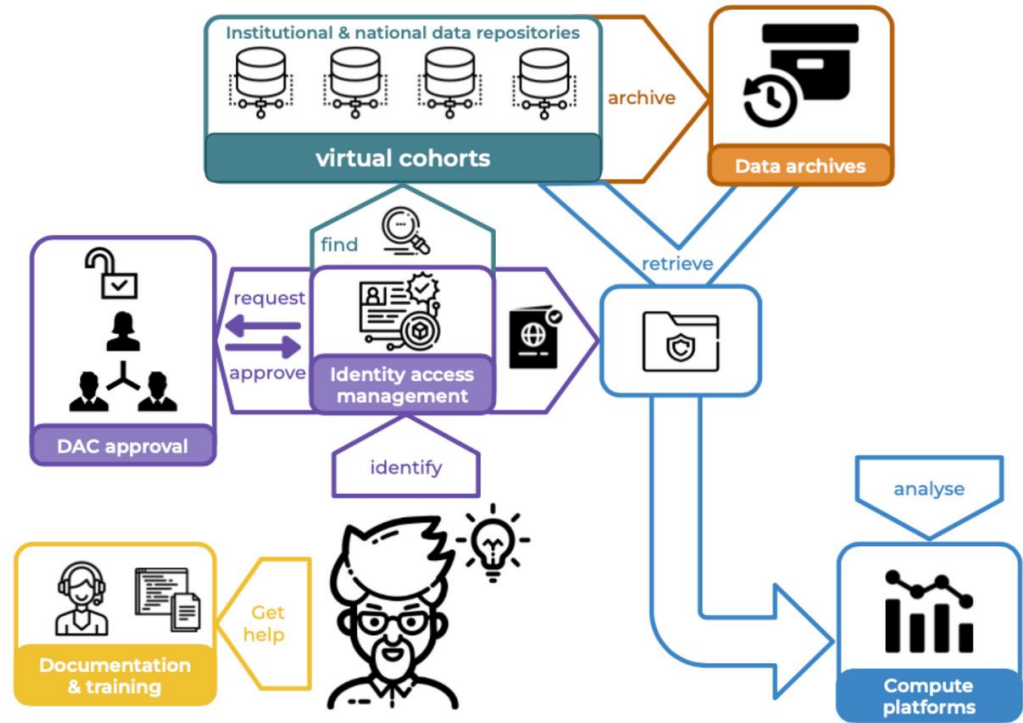

Skill of the BA keeps focus on project outcomes

BABOK® – internationally recognised standard iiba.org

Human Genomes Platform Project

Work Packages

1. Virtual cohorts
2. Streamline the Data Access Control (DAC) committee process
3. Federated identity and access management
4. Data and metadata archiving
5. Documentation and training

Human Genomes Platform Project Partners

QIMR Berghofer
Medical Research Institute

Garvan Institute
of Medical Research

Australian
BioCommons

What we knew when we started

1. Datasets can be siloed
2. Valuable and yet sensitive
3. No dedicated identifier
4. Onshore - NAGIM and Australian Genomics work
5. Globally - GA4GH, EOSC Life, NIH, EOSC Life & others work

What we did not know

- How data stored
- Frequency of requests
- File sizes and types
- Technology
- Policies
- Collaborations and future goals

What did we do?

User Stories & Translation:

Functional Requirements

Gathered user stories & translated to functional requirements.

Current State Analysis

Interviewed each partner organisation as to their current state & summarised current state for each.

Domain, Community, Technical:

Non-Functional Requirements

Consider: Global standards & international projects, domain constraints, each organisation's constraints and their current technology, technical skills within the team.

Gap Analysis

Compare the current state to the future state.

Functional requirements translation

User Story - As a **Data Access Control Co-ordinator**

I need to...	...so that
see all the details together to be able to review a data access request	I can efficiently process requests and don't waste time going back to the researcher for further information

Requirement - **The system should**

Requirement	Func/Tech/Policy	Priority
Provide enough details on a DAC form to enable the Committee and Coordinator to review request without recourse to applicant	Functional	Mandatory

Requirements translation example

User Story - As a Principal/Chief Investigator

I need to...	...so that
Be able to add team members to my working group	they have access to the tools and resources we are using on the project.

Requirement - The system should facilitate this...

Requirement HGPP REQ 046	Func/Tech/Policy	Priority
Administrators can create and administer arbitrary subsets of users to limit access to tools, data and storage etc to managed workgroups and also delegate this function to other users as required.	Functional	Mandatory

Candidate Solution Assessment

Requirement HGPP REQ 046	Func/Tech/Policy	Priority
Administrators can create and administer arbitrary subsets of users to limit access to tools, data and storage etc to managed workgroups and also delegate this function to other users as required.	Functional	Mandatory

Requirement - The system should facilitate this...Candidate solution for piloting?

CILogon

Addresses requirement through CManage

Technical / other requirements translation

Leverage all you know about
the partners' current state technology &
technical, legal and domain constraints
to develop technical and non-functional requirements.

Group Review, Scope, Shape

3 essential questions

1. Is this requirement valid?
2. Does it fall within the scope of our subproject work?
3. What priority should it have?

Extra shaping questions

How many/how much?
By when?

Where are we now?

- Building and documenting pilot
- Refining requirements
- Finding new requirements
- *Testing against requirements*
- *Writing training documentation based on requirements*

Refining requirements in pilot

The screenshot displays the HGP Beacon Network dashboard. At the top, there's a navigation bar with links for Register Beacon, Documentation, and Logout. Below this is a header with tabs for Analyses, Biosamples, Cohorts, Runs, Genomic Variants, and Individuals. The main content area is divided into a SUMMARY section on the left and a RESULTS section on the right. The SUMMARY section shows 'Query Options' and '1000 INDIVIDUALS'. The RESULTS section features a table with columns for Id, T1, Disease, AgeRange, T1, Sex, T1, and T2. A dropdown menu is open over the 'Disease' column, showing 'Ascending' and 'Descending' options. To the right of the table, there's a sidebar with various filters including KaryotypicSex, Sex, Diseases, Ethnicity, Exposures, GeographicOrigin, Id, Info, InterventionsOrProcedures, Measures, Pedigrees, PhenotypicFeatures, and Treatments. A 'Clear all filters' button is visible. At the bottom, there's a text box with the text 'Medical ontology search method refinement'.

Human Genomes Platform Project right now

- Clear plan
- Collaborative team
- Outcome focused
- Integration is easier

Feedback on the Requirements Process

John Pearson, Manager, Genome Informatics Group - QIMR Berghofer

‘We always do what we call “requirements analysis” before creating new software but having been through the process with the business analyst, **what we have been doing is rocks and sticks compared to the formal process.** It made it very much easier to look at our options for DAC software and make an informed choice. So much better than doing a software evaluation and ending up with the result being, to quote a famous Qld Federal Senator... “I don’t like it!”’

Takeaways

Whether captured in a matrix, in Jira/Confluence, or on post it notes or sketches

- Document requirements – if it's not written down it does not exist
- Review and shape and scope as a team
- Keep your requirements fresh
- Test your build against the requirements
- Use them as a reference for training and change docs – look for opportunities
- Use an experienced Business Analyst and entrust the process to them
